Motivation

- How similar are these sentences ?

Motivation

- How similar are these sentences ?
  - s1: Monday, Monday!

Motivation

- How similar are these sentences ?
  - s1: Monday, Monday!
  - s2: Today is a Monday

Motivation

- How similar are these sentences ?
  - s1: Monday, Monday!
  - s2: Today is a Monday
  - s3: Today is a Tuesday

Motivation

- How similar are these sentences ?
  - s1: Monday, Monday!
  - s2: Today is a Monday
  - s3: Today is a Tuesday
  - s4: Is today a Monday

Motivation

- How similar are these sentences ?
  - s1: Monday, Monday!
  - s2: Today is a Monday
  - s3: Today is a Tuesday
  - s4: Is today a Monday
- First order of business: Find a good representation of the text

Proposed Solution

- One-hot encoded vector for the entire vocabulary

Proposed Solution

- One-hot encoded vector for the entire vocabulary

  `vocab` $\sim$ `[Monday, Tuesday, is, a, today]`

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                 [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~                [1, 0, 0, 0, 0]
```

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ∼                [Monday, Tuesday, is, a, today]
s1: Monday, Monday! ∼                 [1, 0, 0, 0, 0]
s2: Today is a Monday ∼               [1, 0, 1, 1, 1]
```

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                 [Monday, Tuesday, is, a, today]
s1: Monday, Monday! ~              [1, 0, 0, 0, 0]
s2: Today is a Monday ~            [1, 0, 1, 1, 1]
s3: Today is a Tuesday ~           [0, 1, 1, 1, 1]
```

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ∼              [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ∼              [1, 0, 0, 0, 0]
s2:  Today is a Monday ∼             [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ∼            [0, 1, 1, 1, 1]
```

- Similarity between sentences: Cosine distance

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ∼                    [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ∼               [1, 0, 0, 0, 0]
s2:  Today is a Monday ∼              [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ∼             [0, 1, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
    - $\mathit{dist}(s1, s2) = \mathit{dist}([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ∼                [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ∼              [1, 0, 0, 0, 0]
s2:  Today is a Monday ∼             [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ∼            [0, 1, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                    [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~                    [1, 0, 0, 0, 0]
s2:  Today is a Monday ~                   [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~                  [0, 1, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                 [Monday, Tuesday, is, a, today]
s1: Monday, Monday! ~                   [1, 0, 0, 0, 0]
s2: Today is a Monday ~                 [1, 0, 1, 1, 1]
s3: Today is a Tuesday ~                [0, 1, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$

- Leads to data sparsity, therefore need more data

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                 [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~              [1, 0, 0, 0, 0]
s2:  Today is a Monday ~             [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~            [0, 1, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$

- Leads to data sparsity, therefore need more data
- Does not capture the context

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                 [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~               [1, 0, 0, 0, 0]
s2:  Today is a Monday ~              [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~             [0, 1, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$

- Leads to data sparsity, therefore need more data
- Does not capture the context
  - Barack Obama said that George bush is a bad man
  - George Bush said that Barack Obama is a bad man

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ∼               [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ∼              [1, 0, 0, 0, 0]
s2:  Today is a Monday ∼             [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ∼            [0, 1, 1, 1, 1]
s4:  Is today a Monday ∼             [1, 0, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $\mathit{dist}(s1, s2) = \mathit{dist}([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $\mathit{dist}(s1, s3) = \mathit{dist}([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $\mathit{dist}(s2, s3) = \mathit{dist}([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$

- Leads to data sparsity, therefore need more data
- Does not capture the context

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                    [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~                 [1, 0, 0, 0, 0]
s2:  Today is a Monday ~                [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~               [0, 1, 1, 1, 1]
s4:  Is today a Monday ~                [1, 0, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $\mathit{dist}(s1, s2) = \mathit{dist}([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $\mathit{dist}(s1, s3) = \mathit{dist}([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $\mathit{dist}(s2, s3) = \mathit{dist}([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$
  - $\mathit{dist}(s2, s4) = \mathit{dist}([1, 0, 1, 1, 1], [1, 0, 1, 1, 1]) = \mathbf{0}$
- Leads to data sparsity, therefore need more data
- Does not capture the context

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ∼                  [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ∼               [1, 0, 0, 0, 0]
s2:  Today is a Monday ∼              [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ∼             [0, 1, 1, 1, 1]
s4:  Is today a Monday ∼              [1, 0, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$
  - $dist(s2, s4) = dist([1, 0, 1, 1, 1], [1, 0, 1, 1, 1]) = \mathbf{0}$
- Leads to data sparsity, therefore need more data
- Does not capture the context
- More frequent words should have more effect

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~              [1, 0, 0, 0, 0]
s2:  Today is a Monday ~             [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~            [0, 1, 1, 1, 1]
s4:  Is today a Monday ~             [1, 0, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$
  - $dist(s2, s4) = dist([1, 0, 1, 1, 1], [1, 0, 1, 1, 1]) = \mathbf{0}$
- Leads to data sparsity, therefore need more data
- Does not capture the context
- More frequent words should have more effect
  - Use Bag of Words approach, where counts are used instead

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                  [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~             [1, 0, 0, 0, 0]
s2:  Today is a Monday ~            [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~           [0, 1, 1, 1, 1]
s4:  Is today a Monday ~            [1, 0, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $\mathit{dist}(s1, s2) = \mathit{dist}([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $\mathit{dist}(s1, s3) = \mathit{dist}([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $\mathit{dist}(s2, s3) = \mathit{dist}([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$
  - $\mathit{dist}(s2, s4) = \mathit{dist}([1, 0, 1, 1, 1], [1, 0, 1, 1, 1]) = \mathbf{0}$
- Leads to data sparsity, therefore need more data
- Does not capture the context
- More frequent words should have more effect
  - Use Bag of Words approach, where counts are used instead
  - e.g. `s1:  Monday, Monday!  ~      [2, 0, 0, 0, 0]`

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~              [1, 0, 0, 0, 0]
s2:  Today is a Monday ~             [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~            [0, 1, 1, 1, 1]
s4:  Is today a Monday ~             [1, 0, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$
  - $dist(s2, s4) = dist([1, 0, 1, 1, 1], [1, 0, 1, 1, 1]) = \mathbf{0}$
- Leads to data sparsity, therefore need more data
- Does not capture the context
- More frequent words should have more effect
  - Use Bag of Words approach, where counts are used instead
  - e.g. `s1:  Monday, Monday!  ~       [2, 0, 0, 0, 0]`
- Feature space grows with vocabulary size

Proposed Solution

- One-hot encoded vector for the entire vocabulary

```
vocab ~                [Monday, Tuesday, is, a, today]
s1:  Monday, Monday!  ~              [1, 0, 0, 0, 0]
s2:  Today is a Monday ~             [1, 0, 1, 1, 1]
s3:  Today is a Tuesday ~            [0, 1, 1, 1, 1]
s4:  Is today a Monday ~             [1, 0, 1, 1, 1]
```

- Similarity between sentences: Cosine distance
  - $dist(s1, s2) = dist([1, 0, 0, 0, 0], [1, 0, 1, 1, 1]) = 0.5$
  - $dist(s1, s3) = dist([1, 0, 0, 0, 0], [0, 1, 1, 1, 1]) = 1$
  - $dist(s2, s3) = dist([1, 0, 1, 1, 1], [0, 1, 1, 1, 1]) = \mathbf{0.25}$
  - $dist(s2, s4) = dist([1, 0, 1, 1, 1], [1, 0, 1, 1, 1]) = \mathbf{0}$
- Leads to data sparsity, therefore need more data
- Does not capture the context
- More frequent words should have more effect
  - Use Bag of Words approach, where counts are used instead
  - e.g. `s1:  Monday, Monday!  ~       [2, 0, 0, 0, 0]`
- Feature space grows with vocabulary size
- Need to learn a low-dimensional representation: Word2Vec

Neural Network

- Neural network as a black box

Neural Network as a black box

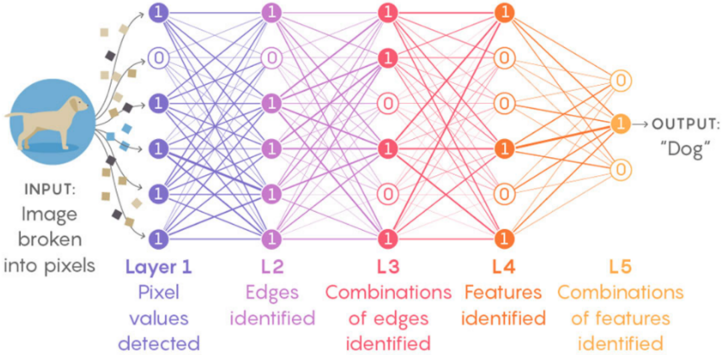
Source: https://www.quantamagazine.org/new-theory-cracks-open-the-black-box-of-deep-learning-20170921/

Neural Network

- To predict Dog vs Cat, the model must learn what is a good representation of dog

Neural Network

- To predict Dog vs Cat, the model must learn what is a good representation of dog



Internal representation of a Neural Network

Source: https://www.quantamagazine.org/new-theory-cracks-open-the-black-box-of-deep-learning-20170921/

Neural Network

- To predict Dog vs Cat, the model must learn what is a good representation of dog
- Internal structure of a neural network is able to represent information

Neural Network

- To predict Dog vs Cat, the model must learn what is a good representation of dog
- Internal structure of a neural network is able to represent information
- Discard the output label, use the hidden layer as the representation for a dog

Word Vectors

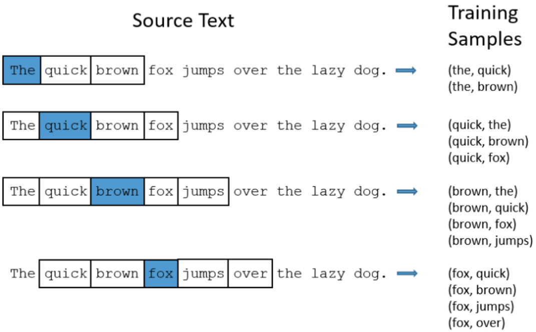
- Intuition: Train a neural network for an “auxiliary” task, and use the learned weights as a representation(word-vectors)

Word Vectors

- Intuition: Train a neural network for an "auxiliary" task, and use the learned weights as a representation(word-vectors)
- Auxiliary Task: Given a specific input word, compute probability for every word in our vocabulary of being the neighbor

Word Vectors

- Intuition: Train a neural network for an "auxiliary" task, and use the learned weights as a representation(word-vectors)
- Break the sentence into small windows(size=2), and create training set for each input word(in blue)

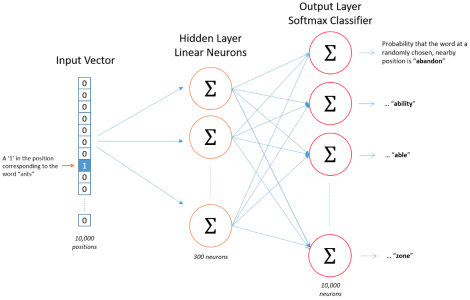


Generating Training Data

Source: *McCormick, C. (2016, April 19). Word2Vec Tutorial - The Skip-Gram Model*

Word Vectors

- Intuition: Train a neural network for an "auxiliary" task, and use the learned weights as a representation(word-vectors)
- Feed the training data as one-hot encoded vectors to the model, such that the output is probability of a word being the neighbor of target word.



Neural Network for training the auxiliary task

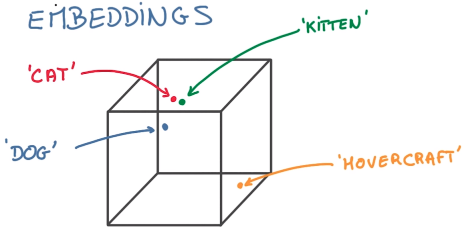
Source: McCormick, C. (2016, April 19). Word2Vec Tutorial - The Skip-Gram Model

Word Vectors

- Intuition: Train a neural network for an "auxiliary" task, and use the learned weights as a representation(word-vectors)
- To efficiently produce neighbor information of a word, the model must learn which words are 'similar' in context, and thus are close in the feature space embedding

Word Vectors

- Intuition: Train a neural network for an "auxiliary" task, and use the learned weights as a representation(word-vectors)
- To efficiently produce neighbor information of a word, the model must learn which words are 'similar' in context, and thus are close in the feature space embedding



Word Embedding

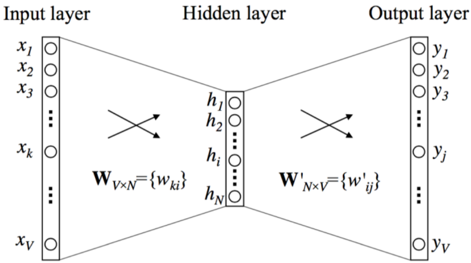
How does Word2Vec work?

- Given an input word, predict single target word

How does Word2Vec work?

- Given an input word, predict single target word



Single context word model

Source: David Meyer, How exactly does word2vec work?

How does Word2Vec work?

- Given an input word, predict single target word
- $X = (x_1, x_2, ...x_V), Y = (y_1, y_2...y_V)$, where V is the size of vocabulary, $x_i \in X$ and $y_i \in Y$ are one-hot encoded vectors

How does Word2Vec work?

- Given an input word, predict single target word
- $X = (x_1, x_2, ...x_V), Y = (y_1, y_2...y_V)$, where V is the size of vocabulary, $x_i \in X$ and $y_i \in Y$ are one-hot encoded vectors
- Hidden layer neurons can be computed by, $h = X^T.W$

How does Word2Vec work?

- Given an input word, predict single target word
- $X = (x_1, x_2, ...x_V), Y = (y_1, y_2...y_V)$, where V is the size of vocabulary, $x_i \in X$ and $y_i \in Y$ are one-hot encoded vectors
- Hidden layer neurons can be computed by, $h = X^T.W$
- For one-hot encoded $x_k = 1$, the above operation copies k^{th} row of W to h, i.e $h = X^T.W = W_{(k,:)} = v_{in}$, where v_{in} is the vector representation of input word

How does Word2Vec work?

- Given an input word, predict single target word
- $X = (x_1, x_2, ...x_V)$, $Y = (y_1, y_2...y_V)$, where V is the size of vocabulary, $x_i \in X$ and $y_i \in Y$ are one-hot encoded vectors
- Hidden layer neurons can be computed by, $h = X^T.W$
- For one-hot encoded $x_k = 1$, the above operation copies k^{th} row of W to h, i.e $h = X^T.W = W_{(k,:)} = v_{in}$, where v_{in} is the vector representation of input word
- Compute the output score for each word in vocabulary V, based on h, $u_j = {v'_{w_j}}^T.h$, where v'_{w_j} is j^{th} column in W'

How does Word2Vec work?

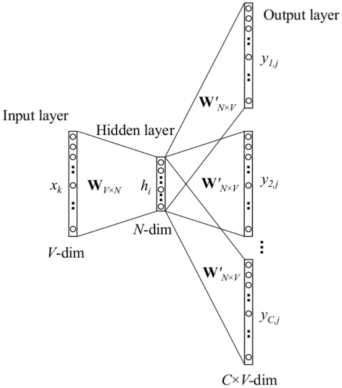
- Given an input word, predict single target word
- $X = (x_1, x_2, ...x_V), Y = (y_1, y_2...y_V)$, where V is the size of vocabulary, $x_i \in X$ and $y_i \in Y$ are one-hot encoded vectors
- Hidden layer neurons can be computed by, $h = X^T.W$
- For one-hot encoded $x_k = 1$, the above operation copies k^{th} row of W to h, i.e $h = X^T.W = W_{(k,:)} = v_{in}$, where v_{in} is the vector representation of input word
- Compute the output score for each word in vocabulary V, based on h, $u_j = {v'_{w_j}}^T.h$, where v'_{w_j} is j^{th} column in W'
- Compute the posterior probability using softmax, $p(w_j|w_{in}) = y_j = \frac{exp(u_j)}{\sum_{j'=1}^{V} exp(u'_j)}$, where y_j is the output of the j^{th} unit in output layer

How does Word2Vec work?

- Given an input word, predict single target word
- $X = (x_1, x_2, ...x_V)$, $Y = (y_1, y_2...y_V)$, where V is the size of vocabulary, $x_i \in X$ and $y_i \in Y$ are one-hot encoded vectors
- Hidden layer neurons can be computed by, $h = X^T.W$
- For one-hot encoded $x_k = 1$, the above operation copies k^{th} row of W to h, i.e $h = X^T.W = W_{(k,:)} = v_{in}$, where v_{in} is the vector representation of input word
- Compute the output score for each word in vocabulary V, based on h, $u_j = {v'_{w_j}}^T.h$, where v'_{w_j} is j^{th} column in W'
- Compute the posterior probability using softmax, $p(w_j|w_{in}) = y_j = \frac{exp(u_j)}{\sum_{j'=1}^{V} exp(u'_j)}$, where y_j is the output of the j^{th} unit in output layer
- The training objective, therefore, is to maximize the conditional probability of observing the actual output word, given the input context word

Word2Vec

- Skip-gram (SG): use a word to predict the surrounding ones in window.

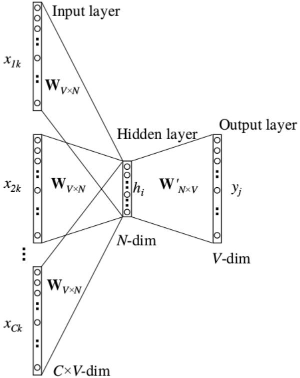


Structure of a Skip-gram model

Source: Xin Rong, Word2Vec Parameter Learning Explained

Word2Vec

- Skip-gram (SG): use a word to predict the surrounding ones in window.
- Continuous Bag of Words (CBOW): use a window of word to predict the middle word



Structure of a Continuous Bag-Of-Words Model

CBOW

- e.g. "The cat sat on floor" (window = 2)

Conclusions

- Word2Vec can efficiently learn word-embeddings in a lower-dimension space such that similar words cluster together
